# DISCLAIMER

This Enhanced Preliminary Assessment report is based primarily on the environmental conditions observed at the New Orleans Military Ocean Terminal, located in New Orleans, Louisiana, on 24 October 1989. Past site conditions and management practices were evaluated, based on readily available records and the recollections of people interviewed. Every effort was made, within the scope of the task, to interview all identified site personnel, especially those personnel with a historical perspective of site operations.

No environmental sampling was conducted as part of the assessment. The findings and recommendations for further action are based on WESTON's experience and technical judgment, as well as current regulatory agency requirements. Future regulations as well as any modifications to current statutes may affect the compliance status of this site.

WESTON does not warrant or guarantee that the property is suitable for any particular purpose or certify any areas of the property as "clean." A more thorough investigation, including intrusive sampling and analysis for specific hazardous materials, is recommended prior to reporting this property as excess.

#### EXECUTIVE SUMMARY

# BACKGROUND AND OBJECTIVES

This Enhanced Preliminary Assessment (PA) report has been prepared by Roy F. Weston, Inc. (WESTON) at the request of the U.S. Army Toxic and Hazardous Materials Agency (USATHAMA) pursuant to Contract DAAA15-88-D-0007, Task Order 2. The purpose of the PA report is to present WESTON's findings concerning the environmental conditions at the New Orleans Military Ocean Terminal (New Orleans (MOT) in New Orleans, Louisiana, and to provide recommendations for further action.

The objectives of the PA were to:

- Identify and characterize environmentally significant operations (ESOs) associated with the historical and current use of the New Orleans MOT property.
- Identify and characterize possible impacts of the ESOs on the surrounding environment.
- Identify additional environmental actions, if any, that should be implemented for the ESOs identified.

Information contained in this enhanced PA report was obtained through:

- Visual inspection of the facility.
- Review of available Army documentation.
- Review of related regulatory agency files at the state and federal levels.
- Interviews with current employees at New Orleans MOT.

#### GENERAL PROPERTY DESCRIPTION

New Orleans MOT is located at the intersection of the Mississippi River and the Inner Harbor Navigational Canal. Construction of the New Orleans MOT was completed in 1919. In 1922, fire destroyed the wooden wharves and the wharfhouse. Reconstruction of the facility was completed in 1942. New Orleans MOT is currently the responsibility of the Army with the U.S. Maritime Administration and the Board of Commissioners, Port of New Orleans, the current tenants. New Orleans MOT is located adjacent to a Naval Support Activity (NSA).

The facility can be divided into two major activities: warehousing and shipping and privately owned vehicle (POV) shipment preparation. New

# Marien"

Orleans MOT has had the assignment to ship materials through New Orleans since 1919, although this activity was interrupted to an uncertain extent from 1922 to 1942. Currently a wide range of equipment and material is processed through this facility including:

Military equipment

Privately owned vehicles.

Supplies for Post Exchanges (PXs).

Ordnance.

Chemicals and Compressed Gases.

These duties and materials handled have not changed significantly since World War II.

# ESOs identified on the property include:

- Underground Storage Tanks (USTs). Three active, one inactive, three former, and three potential tanks were identified. The three former tanks were removed in 1982; one was found to be leaking. The extent of cleanup is unknown. Three tanks were subsequently installed as replacements. The active tanks store gasoline and diesel fuel for vehicles used onsite. Installation of monitoring wells around the known tanks is scheduled. Any remaining contamination from the former leaking tank will be discovered by the groundwater monitoring of these wells. Two potential tanks were identified as a fuel station. The pumps were removed in 1979, but the tanks are believed to have been left in place.
- Transformers. Nineteen transformers at six stations were identified. These units have not been tested for polychlorinated biphenyls (PCBs) and are the operational responsibility of the NSA. The transformers are in good condition and there is no visual evidence of spills in the past.
- Fuel Unloading Area. Gasoline is pumped out of privately-owned vehicles in preparation for shipment. This fuel is stored in an underground storage tank and subsequently reused within the facility.
- <u>Vehicle Wash Rack</u>. A concrete pad was reported to have been used for vehicle washing. The surrounding area is unpaved. Washwater would have seeped into the surrounding soil. There is no information regarding vehicle maintenance on this pad.
- Railroad Tracks. A large railyard formerly covered approximately 320,000 sq ft of the property. Many of the lines have been removed or paved over with asphalt. This area is a source of contamination from spills or petroleum, oil and lubricants (POL) and solvents from train activities during loading/unloading operations.
- Berths 1 to 5. These berths have been used since World War II for general storage and warehousing operations. The variety of

# WESTERN.

hazardous materials stored currently is quite extensive and includes munitions, compressed gases, corrosives, flammables, and oxidizers. The floor of the facility is concrete with holes drilled to allow discharge directly to the Mississippi River or fill sediment under the berth. The largest container present at the time of the survey was a 55-gal drum. Approximately 2,000 gal of hazardous material was surveyed.

• <u>Asbestos</u>. Transite siding was tentatively indentified on Buildings 623 and 624. This material is known to contain asbestos fibers. None of the buildings have been surveyed for asbestos.

The identified ESOs for New Orleans MOT are shown in Figure 3-1.

# **HUMAN AND ENVIRONMENTAL RECEPTORS**

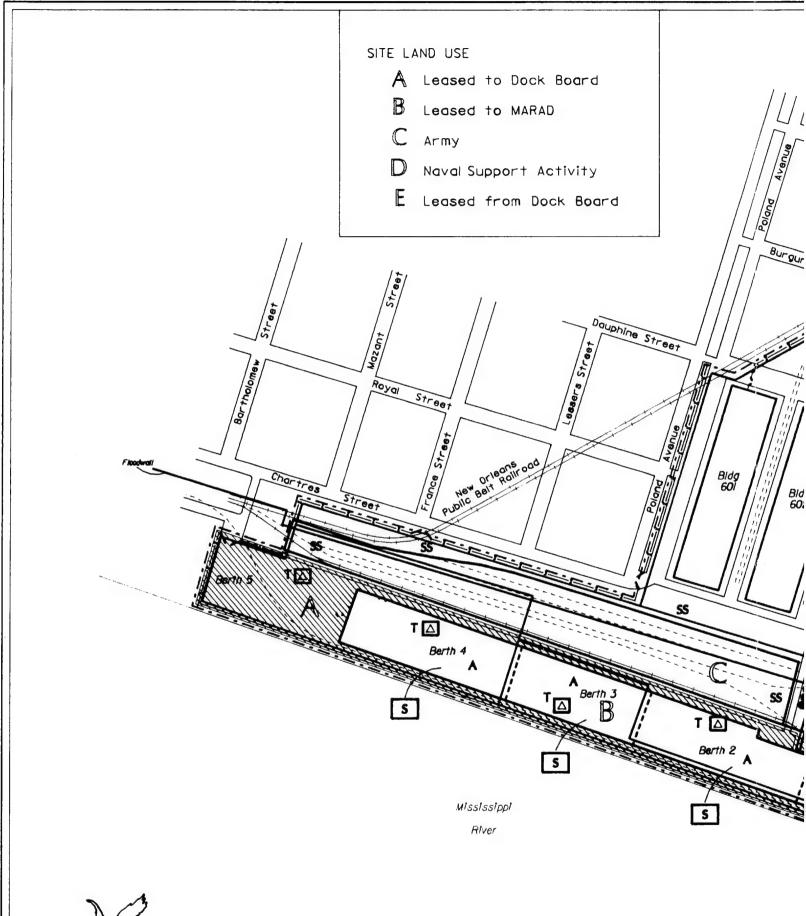

The area surrounding New Orleans MOT is heavily populated with commercial activities along the river. The property is located within a floodplain, although it is protected by a levee. There are wetlands within one mile of the facility. At least seven waterbird nesting colonies are found within this portion of the river.

The significant aquifers in this area range from brackish to saline. The shallow groundwater is less than 10 ft below the surface. All registered wells within 3 miles are drilled to a depth of 700 to 800 ft.

# CONCLUSIONS AND RECOMMENDATIONS

No environmental conditions were observed on the property that appear to present an immediate, substantial threat to human health or the environment. The ESOs discussed in the report do have the potential to affect human health or the environment. The recommendations concerning each ESO follow and are summarized in Table ES-1. Recommended sampling locations are shown in Figure ES-1.

- <u>Underground Storage Tanks</u>. No further action is recommended for the identified tanks because monitoring wells are scheduled to be installed. The two potential tank locations should be investigated to ascertain their existence.
- <u>Transformers</u>. All transformers should be tested for PCBs.
- <u>Fuel Unloading Area</u>. The building's trench drains provide the most likely pathway for the migration of contaminants. The sewer sediments should be sampled and analyzed for total petroleum hydrocarbons (TPH).
- Vehicle Wash Rack. The surrounding soil should be sampled because washwater that may have contained oil and grease would have drained to the surrounding ground. The sample collected should be analyzed for TPH and RCRA metals.

# W.STEN.

- Railroad Tracks. POL, solvents from train activities, and hazardous materials from potential spills during unloading may be present in the soil. Soil samples should be collected where tracks are still present or were in the past. Approximately 40 sampling locations are recommended. These samples should be composited into a total of ten samples and analyzed for TPH, pesticides, and base neutral acid extractable compounds (BNAs) on EPA's priority pollutants list.
- Berths 1 to 5. Drainage holes drilled through the floors of the berths provide the most likely pathway for the migration of contaminants. These holes drain to the Mississippi River or fill sediment under the berths. Although there are no spills on record, it is possible that spills occurred in the past. The fill sediment should be sampled under the drains. The samples should be analyzed for priority pollutants, given the uncertainty of the chemicals which may have been spilled.
- Asbestos. An asbestos survey is recommended for the entire facility because none has been performed to date.

### SECTION 1

#### INTRODUCTION

# 1.1 BACKGROUND

Roy F. Weston, Inc. (WESTON) has been retained by the U.S. Army Toxic and Hazardous Materials Agency (USATHAMA) to conduct waste site characterizations of specific Department of Army properties under the authority of Contract DAAA15-88-D-0007, Task Order 2. This work is being performed within the scope of the U.S. Army Installation Restoration Program (IRP). As part of this contract, WESTON has also been asked to prepare enhanced preliminary assessment (PA) reports of selected properties destined to be included as part of the Base Closure Program. The PA reports are to present WESTON's findings concerning the environmental conditions of the properties and to provide recommendations for further action. These recommendations will serve as a guide to the U.S. Army in prioritizing the activities required to report these properties as excess.

This report discusses the enhanced preliminary assessment of the New Orleans Military Ocean Terminal (New Orleans MOT). A site visit was performed on 24 October 1989.

# 1.2 OBJECTIVES

This enhanced PA report was prepared using existing information obtained from property records and from current employees. No sampling activities were completed as part of this assessment.

The overall objectives of the PA were as follows:

- Identify and characterize environmentally significant operations (ESOs) associated with the historical and current use of the New Orleans MOT property.
- Identify and characterize possible impacts of the ESOs on the surrounding environment.
- Identify additional environmental actions, if any, that should be implemented for the ESOs identified.

Certain issues have been excluded from consideration as ESOs for the purposes of this report. First, painted surfaces will not be identified as ESOs solely because there is a potential for their containing lead. Second, drinking water will not be designated as an ESO solely because there is a potential for lead contamination due to piping solder or piping materials. Third, the presence of radon gas in buildings will not be considered as an ESO. A radon survey of all buildings will be performed utilizing the guidelines set forth in the Army Radon Program.

# 1.3 PROCEDURES

The information contained in this enhanced PA report is based on the following data-gathering activities:

Visual inspection of the facility.

Review of available Army documentation.

Review of U.S. Environmental Protection Agency Region VI files.
Contact with the Louisiana Department of Environmental Quality.

Interviews with current employees at New Orleans MOT.

No sampling or analysis was conducted as part of the investigation.

#### 1.4 REPORT FORMAT

This enhanced PA report presents an evaluation of the relevant data for the New Orleans MOT site.

Section 2 describes the property and the surrounding environment and land uses. Section 3 identifies and characterizes all ESOs related to known and suspected releases to the environment. Section 4 discusses the potential impact of the ESOs on the local environment and human receptors. Section 5 summarizes the findings and conclusions, discusses the quality and reliability of the supporting information, identifies areas requiring further action, and suggests how such actions may be accomplished. Section 6 lists the pertinent materials reviewed and the agencies that were contacted. Photographs taken during the site visit are provided in Section 7. Supporting documentation is provided in Appendices A through F.

References are presented throughout this report, where appropriate, by means of a letter and number designation in brackets, as follows: I refers to Direct Interviews; T refers to telephone conversations; and R refers to Reports or other written documents. The number following the letter refers to the specific item in the respective lists provided in Section 6.

# **SECTION 2**

# PROPERTY CHARACTERIZATION

# 2.1 GENERAL PROPERTY INFORMATION

New Orleans MOT is located on the northwest intersection of the Mississippi River and the Inner Harbor Navigational Canal (Mississippi River-Gulf Outlet Canal) within the corporate limits of New Orleans, Louisiana. This installation is also known as the New Orleans Army Base and as the Gulf Outport. An area map and a property information summary are shown in Figure 2-1 and Table 2-1, respectively.

New Orleans MOT is comprised of property operated by the Army, property used by the U.S. Maritime Administration (MARAD) per an Interservice Support Agreement (ISSA), property leased to the Board of Commissioners, Port of New Orleans (Dock Board), and property leased from the Dock Board. This land belongs to the city with all improvements belonging to the Army. Contiguous to the facility is the Naval Support Activity (NSA). A site map of the facility with property divisions is shown in Figure 2-2.

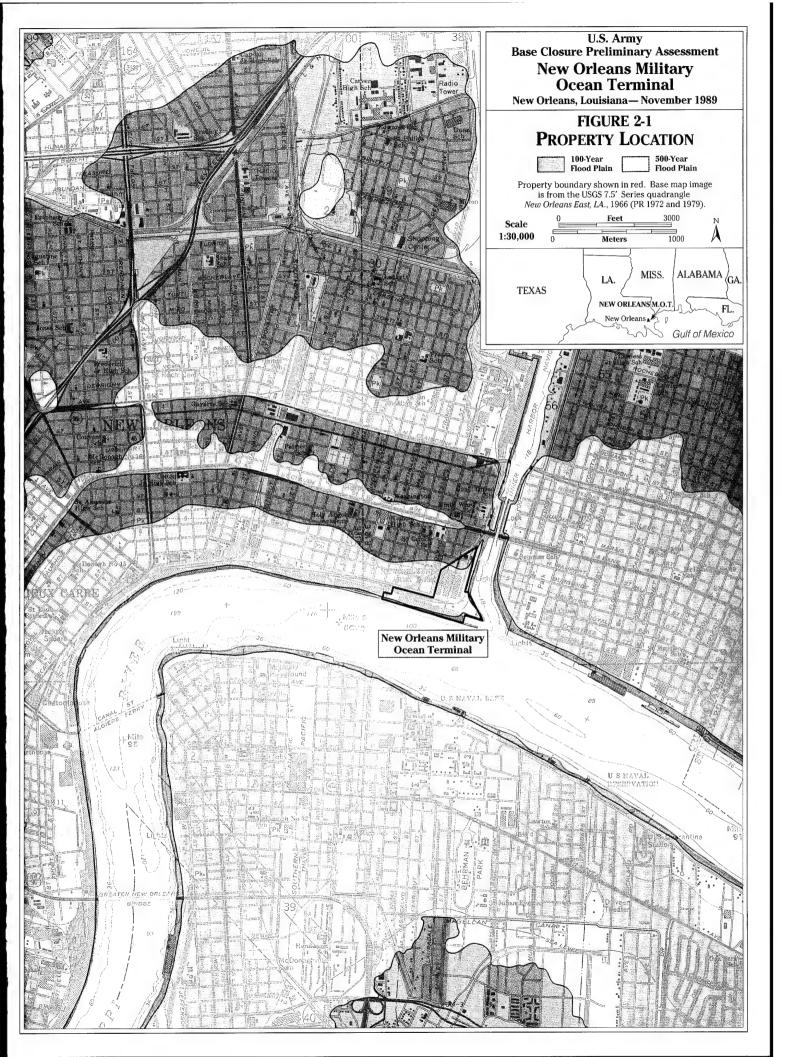

# 2.2 DESCRIPTION OF FACILITIES

# 2.2.1 GENERAL PROPERTY DESCRIPTION AND HISTORY

Construction of New Orleans MOT was completed in 1919. On 15 September 1922 fire destroyed the wooden wharves and wharfhouse. Reconstruction of the facility continued in three stages until completion of Berths 1 through 4 in 1942. Berth 5 was added in 1945. Berths 1 through 4 are enclosed and Berth 5 is open (photos 1, 2) [R-4].

All of the berths are built on timber pile foundations and consist of reinforced concrete and structural steel above the water level. The structures cover a total of approximately 499,711 sq ft (11.47 acres). Transit sheds cover Berths 1 through 4 for a total enclosed area of approximately 281,848 sq ft. Berths 1, 2 and part of 3 are used by New Orleans MOT. The rest of Berth 3 and the wharf space in front of Berths 1, 2, and 3 are leased to MARAD. Berths 4 and 5 and the remaining wharf space is leased to the Dock Board. Located on the NSA property are three warehouses that are used to store most of the material processed through New Orleans MOT [I-1; R-4].

The facility can be divided into two major activities: warehousing and shipping, and privately-owned vehicle (POV) shipment preparation. New Orleans MOT has had the assignment of shipping materials through New

#### Table 2-1

# Property Information Summary

Name: New Orleans Military Ocean Terminal

Facility Address: Military Traffic Management Command

Gulf Outport

4400 Dauphine Street

New Orleans, LA 70146-6000

FFIS: LA-213522703

Property Number: 22585

Command: Military Traffic Management Command

County: Orleans Parish

Location: At the northwest intersection of the Mississippi

River and the Inner Harbor Navigation Canal (Mississippi River-Gulf Outlet Canal) within the

corporate limits of New Orleans, Louisiana.

Installation Coordinates: 29°57'N; 90°01'W

Size: 14.99 acres

Mission: To provide common user terminal services for

Department of Defense (DoD) sponsored cargo through Gulf Coast ports from Brownsville, Texas, to Cape Sable, Florida. Operate privately owned vehicle

(POV) Processing Center, Granite City, Illinois

Operations: Current operations include warehouse and shipping

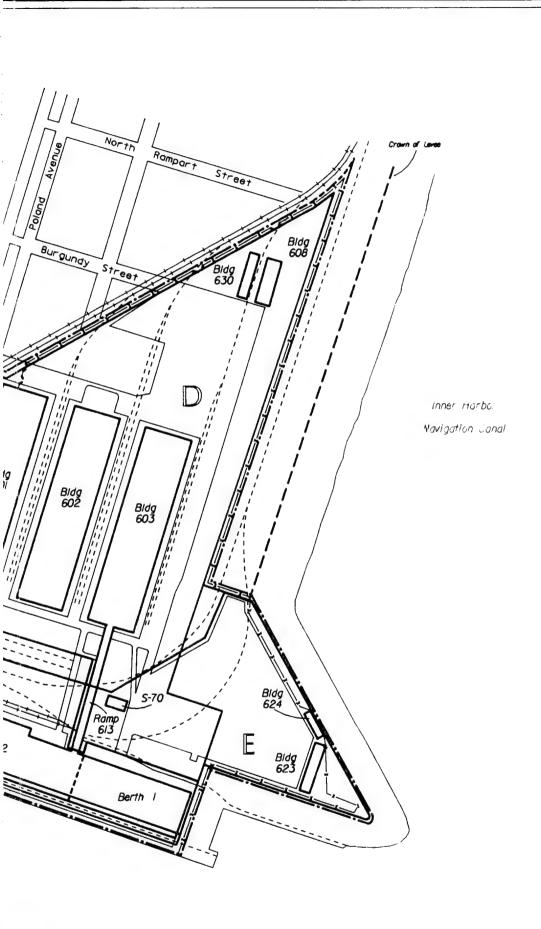

activities and POV vehicle pre-shipment main-

tenance.

Orleans since 1919, although this activity was interrupted to an uncertain extent from 1922 to 1942. Currently a wide range of equipment and material is processed through this facility including:

- Military equipment.
- POVs.
- Supplies for post exchanges (PXs).
- Ordnance.
- Chemicals and compressed gases.

The equipment and materials handled have not changed significantly since World War II. A more detailed breakdown of equipment and materials handled is provided in Appendix A. A detailed discussion of the identified ESOs as they relate to hazardous materials handled is presented in Section 3.

Also present at this installation is a POV processing center and shipping facility. All fuel is removed from the vehicles prior to shipment. Outdoor POV storage consists of approximately 9.04 acres leased from the Dock Board and NSA.

# 2,2,2. GENERATION AND DISPOSAL OF WASTES

Solid waste is stored in roll-off containers prior to its disposal by a private contractor. The current contractor is River Parish Disposal, Inc. There is no generation or disposal of hazardous waste at the facility. Sanitary wastewater is discharged to the city sanitary sewer system.

# 2.3 PERMITTING STATUS

The following agencies were contacted regarding the status of permits for New Orleans MOT [T-1; R-8, R-9]:

- EPA Region VI no permits.
- Louisiana Department of Environmental Quality (DEQ), Office of Air Quality and Nuclear Energy - no permits.
- Louisiana DEQ, Office of Water Resources no permits.
- Louisiana DEQ, Office of Solid and Hazardous Waste no permits.

The facility's EPA Hazardous Waste Generator I.D. Number is LA5-21-359-9314 (Appendix B). However, the facility has identified itself as a non-generator of hazardous waste. There is no record of any hazardous waste manifested [T-1]. New Orleans MOT also submitted an Underground Storage Tank Registration, listing four tanks (Appendix C). The status of these tanks will be discussed in greater detail in Subsections 3.1 and 3.2.

# 2.4 GENERAL ENVIRONMENTAL INFORMATION

### 2.4.1 DEMOGRAPHICS AND LAND USE

New Orleans MOT is located on the Mississippi River in New Orleans. The surrounding land is mainly residential with some commercial activity. Other shipping and warehousing operations are located along the river.

No nearby contamination sources were identified in the Comprehensive Environmental Response, Compensation Liability Inventory System (CERCLIS) listing for New Orleans (Appendix D). Other than local port operations along the river, no likely sources were identified either during personnel interviews or the site survey [I-1, I-2].

#### 2.4.2 CLIMATE

The climate of New Orleans is humid and semi-tropical during a large portion of the year. New Orleans is virtually surrounded by water. The water bodies include the Gulf of Mexico, Lake Pontchartrain, Lake Borgne, and numerous bayous, lakes, and marshy delta land. These water bodies have a significant influence on the climate. New Orleans is south of the usual track of winter storms, but occasionally a storm center will form in the Gulf of Mexico.

Figure 2-3 shows wind conditions for New Orleans for the year 1988. The wind direction at New Orleans is fairly evenly distributed. North winds occur most frequently with a secondary maximum of south winds. Summer winds have a prevailing southerly direction providing moisture favorable for the formation of afternoon thunderstorms. West to northerly winds cause periods of hot dry weather during the summer.

Precipitation is fairly evenly distributed throughout the year. A definite rainy period occurs from December to March. Summer precipitation occurs mainly from frequently heavy showers and thundershowers. July (6.73 in.), August (6.02 in.) and September (5.87 in.) are the wettest months. October is the driest month with normal precipitation of 2.66 in. The maximum monthly precipitation recorded was 25.11 in. during October 1937. Snowfall is rare with a annual mean value of 0.1 in.

Temperatures are moderated by the surrounding water bodies. July is the hottest month with a normal monthly temperature of 82.1°F and a daily maximum of 90.7°F and a daily minimum of 73.5°F. The daily maximum temperature during June (89.5°F), July (90.7°F), and August (90.2°F) show little variation. January is the coldest month with a normal monthly temperature of 52.4°F, and a daily maximum of 61.8°F and daily minimum of 43.0°F.

Severe thunderstorms with damaging winds and hail are infrequent. Thunderstorms with heavy rains are common. Thunderstorms occur on an average of 68 days per year. Tornadoes are rare, but water spouts occur quite often on nearby lakes. Hurricanes and tropical storms do move close enough to New Orleans to affect the area. Tropical storms can produce high winds, heavy rain, flooding, and tornadoes. Severe damage can occur during tropical storms. Although these storms have occurred in the past, the frequency of occurrence is quite low [R-10, R-11].

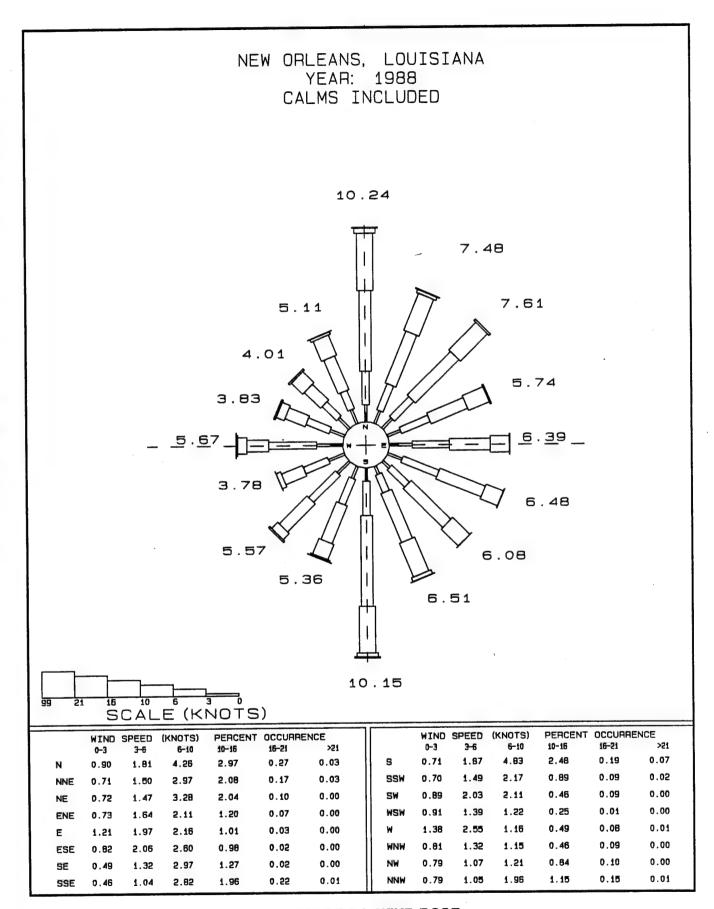

FIGURE 2-3 WIND ROSE

# 2.4.3 SURFACE WATER AND PHYSIOGRAPHY

New Orleans MOT lies below the mean highwater of the Mississippi River. The facility is located within a Zone B area, "areas protected by levees from the base flood" [R-12]. The levee has a crest elevation of 24 ft above the Mean Gulf Level (MGL). The river serves as a public drinking water source and is a vital corridor of industrial and commercial activity. Two water treatment plants pump water from the Mississippi River to serve the New Orleans metropolitan area. Both water intakes are located upriver from New Orleans MOT [T-2].

# 2.4.4 SOILS

New Orleans is underlain by thick sequences of unconsolidated deposits of sand, silt, clay, and gravel. Subsurface materials in the New Orleans area consist of recent flood plain and deltaic alluvial deposits associated with river deposits and marshlands. Zones of organic clay characteristic of backswamp material are mixed with these sediments. Loess, a wind-derived sediment composed predominantly of silt-sized grains, may also be present in some areas. Soil material generally consists of silty clays interrupted by dense clay lenses that impede the downward migration of surface water. These materials are deposited in a structural trough known as the Mississippi embayment that plunges gulfward. The resulting wedge of sediments thickens seaward with a prevailing dip to the south [R-3].

The soil consists of lean to fat clays, silts, and fine sands, and contain beds of organic materials and peat bogs up to 10 feet thick. All soils are saturated. Soils vary in makeup from almost nonplastic silts to highly plastic clays, and they contain varying amounts of sand and organic debris [R-4].

#### 2.4.5 GROUNDWATER AND HYDROLOGY

In the New Orleans area, usable quantities of fresh groundwater are difficult to encounter at any depth below the ground surface. The groundwater at the facility was reported as brackish and is believed to be generally 8 to 10 ft below ground. This shallow aquifer is expected to flow toward the river when the river is in low stage and away when the river is high. The shallow aquifers, less than 150 ft, that may exist have low yields. These water-bearing deposits include point bar and distributary channel deposits associated with the Mississippi River [R-2, R-3].

There are approximately 10 registered wells within 3 miles of the facility in the area north of the Mississippi River and west of the Gulf Outlet Canal (Appendix E). The nearest well is located within 1,000 ft of the facility. This well is expected to be brackish. All wells are drilled to a depth of 700 to 800 ft. None of these wells are used as a drinking water source [R-1]. The aquifer pumped in each case is the Gonzales-New Orleans Aquifer. As of 1981 the saltwater-freshwater interface is one mile north of the facility. The other major deep aquifers are also brackish or saline in this area [R-2].

# 2.4.6 FLORA AND FAUNA

The majority of New Orleans MOT is paved. On the unpaved areas, grasses, some shrubs and small trees are present. There are no permanent examples of fauna other than rodents and birds. A list of fauna found in New Orleans is provided in Appendix F.

# 2.4.7 SENSITIVE ENVIRONMENTS

There is no evidence of sensitive wildlife within 3 miles of the facility. The pallid sturgeon, a species proposed for listing, and the salt marsh top minnow, a rare fish, have been detected in the Mississippi River, south of New Orleans. There are wetlands within one mile of the facility. There are at least seven waterbird nesting colonies in this portion of the river and also in the deltaic marshes (Appendix F).

# **SECTION 3**

# **ENVIRONMENTALLY SIGNIFICANT OPERATIONS**

The objective of this section is to document areas where hazardous materials are managed and to identify known or potential releases of these materials into the environment and their likely migration pathways. The locations of all identified ESOs are depicted in Figure 3-1.

# 3.1 UNDERGROUND STORAGE TANKS (RAMP 613)

#### 3.1.1 DESCRIPTION

Three 1,000-gal, single-wall fiberglass tanks are located adjacent to Ramp 613 (photo 3). The tanks are equipped with steel piping. Each tank was installed in 1982 to replace similar steel tanks that had been in place since the 1940s. Diesel fuel for vehicles is stored in Tank 601-1. Tank 601-2 was previously used to store waste fuel. It is currently inactive and reportedly empty. Gasoline is stored in Tank 601-3. These tanks are registered with the state [R-5]. Four monitoring wells for leak detection are planned to be installed before January 1990 [I-2]. The ground above these tanks is paved.

# 3.1.2 KNOWN AND SUSPECTED RELEASES

One of the three tanks replaced in 1982 was found to be leaking [R-5]. The specific tank that leaked and the extent of cleanup that occurred is unknown. The current tanks were leak tested at installation; no leaks were detected.

# 3.2 UNDERGROUND STORAGE TANKS (BUILDING 623)

#### 3.2.1 DESCRIPTION

One 1,000-gal steel tank with steel piping is located west of Building 623. This tank, installed in the 1940s, is used to store fuel mixtures removed from vehicles during pre-shipment processing and is registered with the state [I-2; R-5]. This fuel is reused to operate onsite vehicles. Three monitoring wells for leak detection are planned for installation before January 1990. The ground above this tank is paved.

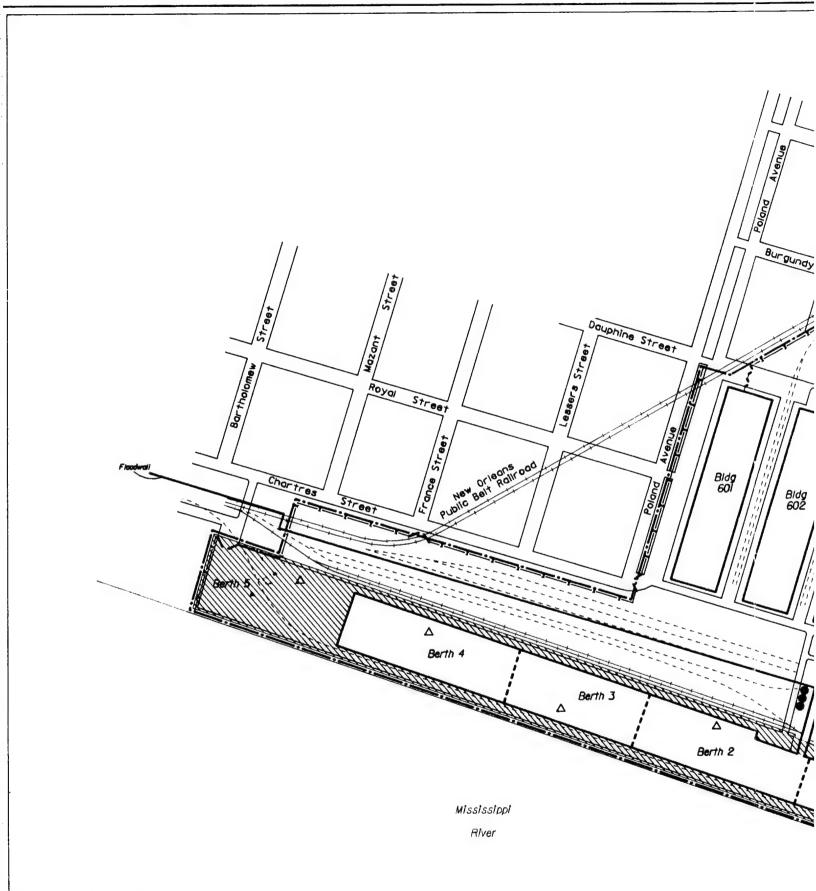

#### 3.2.2 KNOWN AND SUSPECTED RELEASES

This tank was leak tested in 1988 and no leaks were detected.

# 3.3 POTENTIAL UNDERGROUND STORAGE TANKS (BOAT RAMP)

#### 3.3.1 DESCRIPTION

In the past, a fuel pump area was located adjacent to the boat ramp. The gasoline pumps were removed in 1979. It is believed that two tanks were

- (X) General Storage and Material Hauling
- --- Former Railroad
- --- Current Railroad

not removed at that time and remain in the ground. The sizes of the tanks, if present, are not known [I-2; R-5]. This area is paved.

# 3.3.2 KNOWN AND SUSPECTED RELEASES

There is no record of any testing done at the time the fuel pumps were removed.

# 3.4 POTENTIAL UNDERGROUND STORAGE TANK

#### 3.4.1 DESCRIPTION

During the site survey, 1/4-in. steel piping was discovered that led underground behind Building 623, which could indicate a potential tank. However, there is no record of a tank in this location.

#### 3.4.2 KNOWN AND SUSPECTED RELEASES

There is no evidence of vegetation stress in the area.

# 3.5 TRANSFORMERS

# 3.5.1 DESCRIPTION

Six transformers stations were identified during the site survey. All 19 transformers appeared to be in good condition with only slight corrosion visible (photo 4). None of the transformers has been tested for PCBs [I-2].

# 3.5.2 KNOWN AND SUSPECTED RELEASES

There are no visible leaks or stains near any of the transformer stations. A potential release from one of the transformers in the berths would affect either the Mississippi River or the fill under the berths. A potential release from the station on the parking lot would likely seep into the ground through cracks in the asphalt and perhaps to the Gulf Outlet Canal through the storm sewer.

# 3.6 FUEL UNLOADING AREA

### 3.6.1 DESCRIPTION

In Building 623 (photo 5), a small air-operated pump is used to remove fuel from POVs prior to shipment [I-2]. This mixed fuel is subsequently stored in an underground storage tank (see Subsection 3.2) and used onsite to operate vehicles. Building 623 has a concrete floor with a trench drain in the area. These drains reportedly are connected to the city storm sewer [I-1, I-2].

# 3.6.2 KNOWN AND SUSPECTED RELEASES

There is no evidence of releases in the area. The floor is clean and the area is well maintained.

# 3.7 VEHICLE WASH RACK

#### 3.7.1 DESCRIPTION

Prior to 1987, vehicles were washed on a concrete pad behind Building 623 [I-2]. Vehicles have not been washed here since before 1987. There are no drains in the area. The area around the pad is unpaved. There is no information on whether any other maintenance activities, including engine washing, occurred here.

# 3.7.2 KNOWN AND SUSPECTED RELEASES

Wash water would have runoff to the surrounding ground. There is no evidence of vegetation stress nor visible stains in this area.

# 3.8 RAILROAD TRACKS

#### 3.8.1. DESCRIPTION

In the past, this facility made extensive use of rail lines to transport materials. Many of the tracks present in 1963 have since been removed or covered by pavement. Rail lines have been used to transport ordnance, chemicals, and other hazardous materials. An extensive rail yard was present behind the berths. In the past, these tracks covered approximately 320,000 sq ft.

#### 3.8.2 SUSPECTED AND KNOWN RELEASES

There is no record of any spills from the unloading or railroad operations [I-1; T-3]. Since spills due to unloading operations are not uncommon, some chemical releases could have occurred. Any contamination probably would have affected the soil and shallow groundwater.

#### 3.9 BERTHS 1 TO 5

#### 3.9.1 DESCRIPTION

These berths have been used since World War II for general storage and warehousing operations. The variety of hazardous materials currently stored is quite extensive and includes munitions, compressed gases, corrosives, flammables, and oxidizers (photos 6, 7, 8). The floor of the facility is concrete with holes drilled to allow discharge directly to the Mississippi River or the fill under the berths. These holes were drilled to permit drainage flow to low spots. The largest container present at the time of the survey was a 55-gal drum. Approximately 2,000 gal of hazardous material was surveyed, based on a drum count. Incompatible materials are not segregated.

#### 3.9.2 SUSPECTED AND KNOWN RELEASES

There is no record of any spills from the unloading or warehouse operations [I-1, I-4; T-3]. Some chemical releases could have occurred because spills due to unloading operations are not uncommon. Any spill that was not cleaned up would most likely have drained to the Mississippi River or to the fill under the berths.

# 3.10 ASBESTOS

# 3.10.1 DESCRIPTION

Transite siding was tentatively identified on Buildings 623 and 624 (photos 9, 10). This material is known to contain asbestos fibers. None of the buildings, however, has been surveyed for asbestos.

# 3.10.2 KNOWN AND SUSPECTED RELEASES

There is no documentation of asbestos release. No damaged insulation was observed.

### **SECTION 4**

#### **HUMAN AND ENVIRONMENTAL RECEPTORS**

The pathways by which human and environmental receptors may be exposed to site-related chemicals are discussed in this section.

# 4.1 GROUNDWATER

Infiltration and percolation to the groundwater is minimal because much of the property is paved. The groundwater in this area is brackish and unfit for consumption. Drinking water for the greater New Orleans area is obtained from the Mississippi River. If any contaminants were to penetrate the asphalt or concrete floors of the buildings through cracks, they could reach the groundwater 8 to 10 ft below. All registered wells within 3 miles are drilled to 700 to 800 ft, and it is anticipated that they would not be affected by the contaminants. The shallow groundwater would be expected to eventually discharge to the Mississippi. However, the concentrations would be expected to be quite dilute. There are no records of the shallow groundwater being used in this region. The effects on human and environmental receptors exposed to groundwater are anticipated to be minimal.

# 4.2 SURFACE WATER

Stormwater runoff is collected by stormwater sewers and is discharged to the city storm sewer system, which discharges to the Gulf Outlet Canal. No ongoing discharges or surface contamination was apparent during the site inspection; therefore, no impact on human and environmental receptors from surface water is expected. Any spills in the berths could drain directly to the Mississippi River, or to the fill land underneath the berths. Contaminants, if present in this sediment, could leach or be eroded into the Mississippi River. Any contaminants that would reach the river would be significantly diluted. Impact on aquatic life and waterbirds in the area is expected to be low.

#### 4.3 AIR

No permanent sources of air contaminants are known to be present onsite. Therefore, no human or environmental receptors would be impacted by air contaminants at the site. However, the potential exists for exposure to asbestos from the siding in some of the buildings if it is removed or damaged.

# 4.4 SOILS

Because most of the site is paved with asphalt, little direct contact with contaminated surfaces is anticipated. An underground storage tank, which was replaced in 1982, was found to have leaked. The effect of this release to the environment is unknown. There is no evidence of leakage from

transformers or any other releases to the soil. Soil contamination from organics near the vehicle wash rack or the railroad tracks is possible, and could present a direct contact hazard to workers in these areas. A spill in one of the berths could drain to the fill land underneath.

# 4.5 OTHER HAZARDS

#### 4.5.1 FIRE AND EXPLOSIONS

Transformers present a risk of fire and explosion. However, the risk of fire and explosion does not appear to be any greater than for transformers at other industrial sites. Once chemicals stored at the site are removed prior to property transfer, there would be no other known fire or explosion hazard present.

# 4.5.2 DIRECT CONTACT

The walls and floors of buildings that housed hazardous materials may have absorbed contaminants that could be contacted by personnel at a later time. Such buildings include Buildings 623, 624, and the five berths. Building surfaces, if contaminated, may provide a direct contact hazard to site personnel.

### **SECTION 5**

### CONCLUSIONS AND RECOMMENDATIONS

### 5.1 SUMMARY OF FINDINGS

New Orleans MOT is a large, urban warehouse and shipping operation located on the Mississippi River. The facility is located in a residential section of New Orleans. Construction of the facility began in 1917. Wetlands have been identified within one mile of the facility.

There are approximately 10 registered wells within 3 miles of the installation. None are used for drinking water. The aquifer used in this area is approximately 700 ft deep.

There are few operations that would adversely impact local human and environmental receptors. These are summarized in the following subsections.

### 5.1.1 UNDERGROUND STORAGE TANKS

Four existing and three potential underground storage tanks are present at the facility. Monitoring wells are to be installed by the end of 1989 around the four known underground storage tanks.

- Tank 601-1 Diesel fuel.
- Tank 601-2 Waste fuel (currently inactive).
- Tank 601-3 Gasoline.
- Tank 623 Recycled fuel from unloading operation.

A former pump station equipped with two underground storage tanks was also identified. These tanks are believed to be still present. During the survey, a number of 1/4-in. steel pipes that ran underground were found behind Building 623, which indicates a potential tank. These operations are mainly a threat to soil and shallow groundwater.

### **5.1.2 TRANSFORMERS**

None of the transformers onsite appeared to be leaking. However, they have not been tested for PCBs. Ownership and operational responsibility was reported to be the NSA's. A potential release from one of the units in the berths would affect either the Mississippi River or the fill under the berths. A potential release from the station on the parking lot would likely seep into the ground through cracks in the asphalt and perhaps to the Gulf Outlet Canal through the storm sewer.

### 5.1.3 FUEL UNLOADING AREA

The fuel unloading operation takes place inside Building 623 over a concrete floor. Gasoline is pumped out of POVs prior to shipment. Past spills would

likely have reached the drains in the building, which discharge to the storm sewer.

### 5.1.4 VEHICLE WASH RACK

A concrete pad behind Building 623 was used to wash vehicles. Washwater can be expected to have seeped into the surrounding ground because there are no drains nearby. It appeared that the water would potentially drain from one corner of the pad to the ground.

### 5.1.5 RAILROAD TRACKS

Rail lines were used extensively to transport hazardous materials including ordnance and chemicals. Many of the tracks present in 1963 have either been removed or paved over. Potential past spills during loading operations would have affected the soil. More mobile contaminants could have migrated to the shallow groundwater.

### 5.1.6 BERTHS 1 TO 5

These warehouse facilities have been used to store chemicals and ordnance since at least World War II. At the time of the survey, compressed gases, corrosives, flammables, oxidizers, and ordnance were observed. Any potential spills would be expected to affect either the Mississippi River or the fill material under the berths.

### 5.1.7 ASBESTOS

Buildings 623 and 624 were tentatively identified as having Transite siding, a material known to contain asbestos. No damaged insulation was observed. An asbestos survey, however, has not been performed for these buildings nor the berths.

### 5.2 RECOMMENDATIONS FOR FURTHER ACTION

No conditions were observed on the property that appear to represent an immediate substantial threat to human health or the environment. The ESOs identified have the potential to affect human health or the environment. These recommendations are summarized in Table 5-1 and shown in Figure 5-1. Sampling and additional study is recommended as follows.

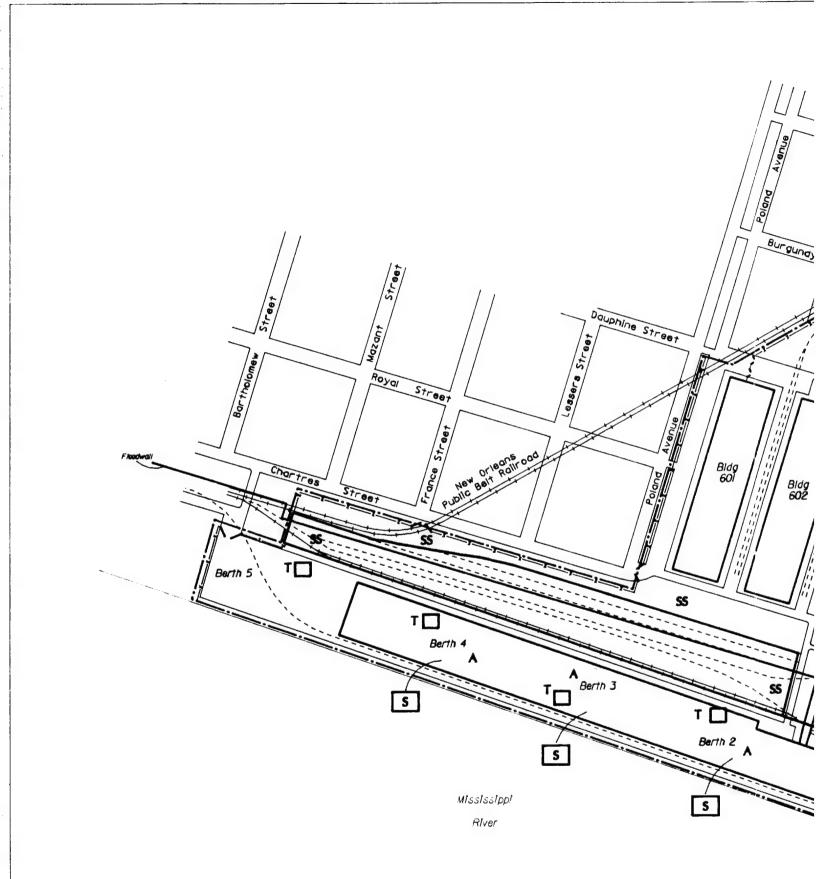

### 5.2.1 UNDERGROUND STORAGE TANKS

No further action is recommended because monitoring wells are planned for the tanks near Ramp 613 and the tank adjacent to Building 623. During the survey, the following areas were identified as potential locations for underground storage tanks: near the boat ramp and behind Building 623. A geophysical survey should be performed in these areas to confirm the presence of tanks.

Table 5-1

ESOs Identified at New Orleans MOT and Recommendations for Further Action

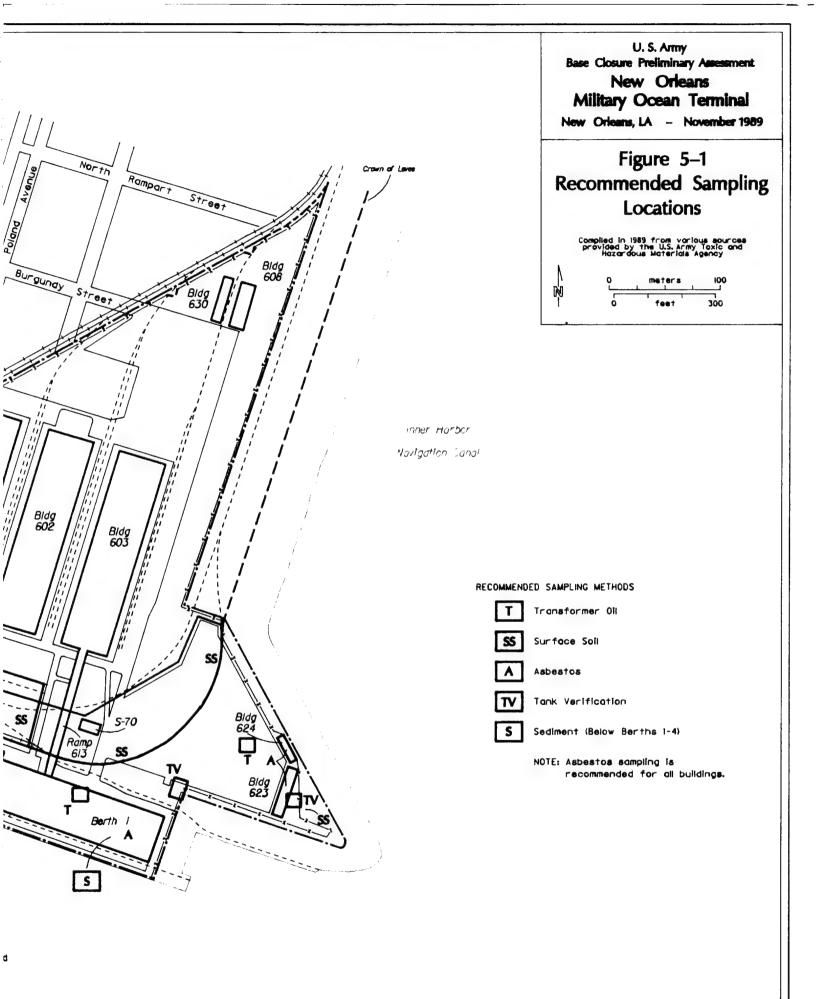

ESOs		Contaminants of Concern	Recommended Activity	Number of Samples	Location	Sample Type	Analysis
Underground Storage Tanks	Storage	Petroleum hydrocarbons	No further action		Next to Ramp 613		
↓ Underground Storage Tank	Storage	Petroleum hydrocarbons	No further action	l	In front of Building 623	I	l
Storage Tank	derground	Petroleum hydrocarbons	Site Investigation		Next to boat ramp	Tank verification	
⟨Potential Underground Storage Tank	derground	Unknown	Site Investigation		Behind Building 623	Tank verification	
	`	PCBs	Site Investigation	l/transformer	Each transformer	Transformer oil	PCBs

2 Vehicle Wash Rack	Rack	Petroleum hydrocarbons	Site Investigation	2	Along drainage path	Soil	TPH and RCRA metals
Railroad Tracks	cks	Creosote, ordnance, solvents, chemicals	Site Investigation	10 composite	Distributed through railyard	Soil	TPH, pesti- cides, and BNAs
Serths 1 - 5	\	Ordnance, solvents, chemicals	Site Investigation	Approximately 15 composite	Sediments present Sediment under drains	Sediment	Priority pollu- tants
/		Asbestos	Site Investigation		Buildings 623 and 624 and Berths 1—4	Asbestos survey	Asbestos

---- Former Railroad

U.S. Army Toxic and Hazardoue Materials Agency

### 5.2.2 TRANSFORMERS

A sample of dielectric fluid should be obtained from each transformer and analyzed for PCBs. Each unit should be labeled appropriately as a PCB, PCB-contaminated, or non-PCB transformer, depending on the individual analytical results.

### 5.2.3 FUEL UNLOADING AREA

A sediment sample in the bottom of the trench drain in the fuel unloading area should be sampled and analyzed for TPH. The drain is the most likely pathway for any fuel spills.

### 5.2.4 VEHICLE WASH RACK

Split-spoon soil samples taken at a depth of 18 in. should be collected at two locations along the drainage pathway from the concrete wash rack. Samples at each location should be analyzed for TPH and RCRA metals.

### 5.2.5 RAILROAD TRACKS

Most of the area is now paved. Forty 18-in. split-spoon soil samples should be collected below the asphalt surface. These samples should be distributed throughout the yard and along the single rail line that ran through the facility. These samples should be composited into groups of four and analyzed for TPH, pesticides and BNA compounds on the EPA's priority pollutants list. These compounds represent constituents that may be present from chemicals that may have been stored since World War II.

### 5.2.6 BERTHS 1-5

Sediments under each of the drains should be sampled. There are approximately 15; the exact number of drains is uncertain. Three 18-in. split-spoon samples should be collected from under each drain and composited. The composite samples should be analyzed for priority pollutants because of the uncertainty of the chemicals that may have been spilled since World War II.

### 5.2.7 ASBESTOS

Samples of the siding from Buildings 623 and 624 should be collected. Although no other material was identified, Buildings 623 and 624 and Berths 1 to 4 should be surveyed for asbestos.

### APPENDIX A

### SUMMARY OF OPERATIONS (EXCERPTS)

# current mission and operations

### general

Gulf Outport has the general mission of planning for and accomplishing the expeditious movement of Government-sponsored cargo in the New Orleans/ gulf coast area. As directed by HQ MTMCEA, Gulf Outport must:

- .. Receive, stage, and move all export and import shipments transiting the outport.
- 2. Operate a container freight station.
- 3. Monitor and document all DOD shipments transiting through the Port of New Orleans.
- 4. Pack and crate shipments for the outport and other agencies, as necessary.

- 5. Provide cargo security for Gulf Outport.
- 6. Command troops assigned to the outport.

Within the scope of the Gulf Outport mission are three operational areas: container stuffing, port operations (breakbulk and barge), and personal property ship-ment. Included in the personal property shipment is the receiving and shipping of privately owned vehicles (POVs), as well as the shipping and storage of household goods (HHG).

Since 1973, a general reconfiguration of the cargo operations area has taken place. The cargo operations areas, both import and export, are roughly bounded by Third Street southward to the water and A Street eastward to the levee. The POV processing and storage area is located in the southeastern corner of the outport and in the first four rows of the parking lot north of Building 601 and west of A Street. Household goods are stored mainly on the first floor of Building 601 and in the transit shed. Most administrative offices are located in either Building 601 (second floor) or the transit shed.

A-2

Gulf Outport is considered to be a major tenant of the Navy because it leases, from the Navy, all of its administrative and covered storage space, with the exception of the transit shed and wharf. Other major tenants in the terminal are: the Coast Guard, Military Sealift Command (MSC), Navy Public Works Center, and 4th Marine Air Wing (MAW). The New Orleans Dock Board leases part of the transit shed (sections 4 and 5) (see fig I-2) and the oper wharf area from Gulf Outport.

# port operations

### general

Port operations at Gulf Outport include loading, unloading, and staging of breakbulk and barge cargo, and stuffing and unstuffing of containers. These activities are controlled by the Cargo Operations Division control center, located in Building 601. Gulf Outport currently handles about 44,650 MTON of breakbulk and barge cargo per month and 9,713 MTON of containerized cargo per month (based on FY 78 through FY 80 figures). Under present workloads, existing berth space is adequately used.

at the northeastern corner of Building 601, as shown transit-shed receiving area on the city side of section Cargo enters Gulf Outport by rail and truck. Inbound tractor-trailers/containers receive their documenta-1. When possible, cargo receiving and staging in the and moved to a staging area designated for a specific between warehouses is kept to a minimum, and when tion at the contractor-operated truck control center on the flow chart (fig II-4). From the truck control center, the driver is directed to an unloading dock required, it is done by contractor personnel using along the east side of Building 601 or to the wharf destination or type of cargo. Transferring cargo site. As cargo is taken off the truck, it is sorted warehouses are performed concurrently. Once a truck is spotted, it is completely unloaded at that forklifts and dock trailers.

### breakbulk

Table III-1 shows a commodity profile of breakbulk and containerized cargo handled at Gulf Outport over the last 9 years. General cargo and POVs comprise the majority of cargo at Gulf Outport. The breakbulk workload has taken a downward trend over the last 3 years. Table III-1 shows this trend and the breakout for import and export tonnages. Total breakbulk workload, at present, averages about 44,650 MTON per month.

Most of the breakbulk operations take place in Building 630 and parts of the first floor of Building 601. A layout of the first floor of Building 601 is shown in figure III-1. Other warehouses are used to store cargo that requires special facilities, such as the first floor of Building 602 for POVs requiring special security and Building 608 for hazardous cargo. A walk-through inspection of all warehouses revealed efficient storage of cargo, with a high degree of floor space utilization, averaging about 75 percent. Both of the primary warehouses are parallel to usable rail lines and have loading ramps along their sides to aid in offloading trucks.

Import cargo generally is placed on the city side of Building 630, where it awaits pickup by commercial carrier. Building 630 has a truck-trailer loading ramp running the length of section I westward to the elevated ramp between Buildings 601 and 630 (fig III-2).

# container stuffing/unstuffing

Based on statistics for FY 78 through FY 80, about 18 percent of the cargo is containerized. At present, this amounts to 9,700 MTON a month. Most of the containerized cargo is bound for the Canal Zone, Europe, the Far East, and the Mediterranean. Currently, the breakdown of container stuffing/unstuffing operations is 81 percent general cargo (73 percent in container vans and 8 percent in MILVANs) and 19 percent POVs (in container vans). At times reefer cargo transits the outport; however, this is extremely rare and involves less than 1 percent of container operations.

The first floor of Building 601 is the primary container-stuffing warehouse at Gulf Outport. The east side of Building 601 is where most container operations take place; however, other ramps are available between Buildings 601 and 602, if needed (figs III-3 and III-4). A layout of the container-stuffing warehouse is illustrated in figure III-5. As can be seen, this building is well suited for stuffing operations, with loading docks running the full length of its east and west faces. This building is also accessible by rail on the west side. The rail line to the east side of the building is unusable because parts of it have been paved over in the POV open-storage lot.

# roll-on/roll-off (RORO)

RORO operations are infeasible at Gulf Outport because of excessive tidal variations and the lack of available open-storage area. The nearest accessible RORO facilities are at the France Roads Terminal, located on the Inner Harbor Navigation Canal, north of Gulf Outport. This facility has one stern-loading RORO knuckle, with access from the north and south sides; therefore, it can handle two RORO ships at once. The south side of the knuckle can accommodate any RORO ship in existence today. The north side of the knuckle is very low to the water and can accommodate only smaller size RORO vessels (300 to 400 feet long), which could tie up to mooring clusters. This facility is illustrated in figures III-6 and III-7.

## personal property

Personal property operations at Gulf Outport are divided into POV and household goods categories.

These operations fall under the direction of the Cargo Operations Division.

privately owned vehicles. Povs are handled in either breakbulk or container operations. The following matrix provides condensed information in MTON of POVs processed through Gulf Outport in FY 79 and FY 80:

Total	94, 196	88,255
Container	26,229	23,969
Breakbulk	70,967	64,286
Year	FY 79	FY80

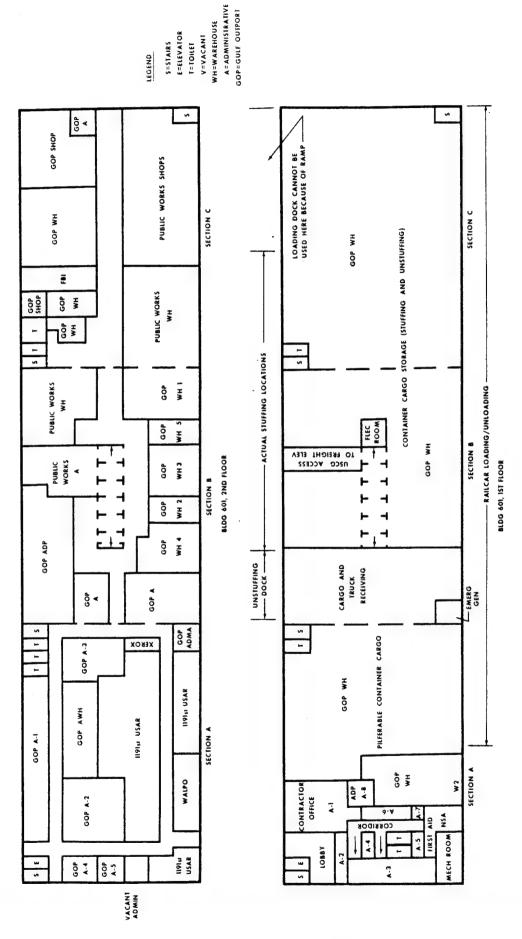

Figure III-5. Layout of container stuffing warehouse.

RORO berth at France Roads Terminal (northward view). Frgure III.

As can be seen, breakbulk handling of POVs is considerably higher than containerization.

dock area on the city side of Building 630. When more vehicles are inspected on the loading dock on the west et Buildings 601 (west side) and 602 (east side) can be covered inspection station for POV operations. After teries are disconnected, and pilferable items are re-When personnel turn in POVs for shipment overseas, side of Building 601. Currently, Gulf Outport has no destination, for export (fig III-9). POVs exported by stuffing positions are needed, the loading dock areas they report to the POV processing office on the first inspection, POVs to be shipped overseas are moved to shipment, they are moved through the processing in front of Building 601. During inclement weather, containers are stuffed into containers at the loading to the staging area adjacent to Building 623. Prior Vehicles are inspected, for preshipment condition, line (Building 623), where the fuel is drained, batmoved (fig III.8). The POVs are then staged, by floor of Building 601, adjacent to Second Street.

Import POV operations are the reverse of export operations. When Gulf Outport is notified by a customer that he/she will be arriving to pick up his/her POV, 1 or 2 days prior to pickup, the POV is moved to the overflow staging lot north of Building 601.

Export POV shipments have been gradually declining over the past several years, while import shipments are up. This is clearly shown in table III-2, which lists shipments handled at Gulf Outport for 1978 through 1980. The yearly peak is seen to occur in

the July to November time frame. During these peak months, the overflow staging area north of Building 601 is usually needed.

At times, POVs are shipped by rail to Gulf Outport. These POVs usually arrive on multilevel railcars and are unloaded on the western side of Building 601. Most POVs arriving this way are imports from Hawaii, which are offloaded on the west coast and then shipped by rail to Gulf Outport. A listing of POV rail shipments to Gulf Outport is shown in table III-3. As can be seen, the peak influx is again during the summer months, with 63 percent arriving from May through September.

household goods. HHG moved through Gulf Outport make up about 12 percent of all breakbulk cargo handled. HHG are staged according to their point of destination (POD), loaded, and exported with other compatible cargo. Export HHG are essentially treated the same as any other breakbulk cargo.

Import HHG are unloaded from a vessel and stored in sections 47 to 53, 64 to 68, and 73 to 77 of Building 630. Storage-in-transit (SIT) HHG taken out of containers are staged on the first floor of Building 602, where they await loading and pickup by commercial carrier. Prior to loading, the Freight Traffic Division, which maintains overall control of import HHG, prepares Government bills of lading for each shipment, to be given to the carrier at the time of pickup. HHG for long-term storage (nontemp) are not stored at Gulf Outport, they are turned over to the Navy for storage.

Not required primilary notification because hazardous wastes are not generated or transported by this organization.

### ACKNOWLEDGEMENT OF NOTIFICATION OF HAZARDOUS WASTE ACTIVITY (VERIFICATION)

This is to acknowledge that you have filed a Notification of Hazardous Waste Activity for the installation located at the address shown in the box below to comply with Section 3010 of the Resource Conservation and Recovery Act (RCRA). Your EPA Identification Number for that installation appears in the box below. The EPA Identification Number must be included on all shipping manifests for transporting hazardous wastes; on all Annual Reports that generators of hazardous waste, and owners and operators of hazardous waste treatment, storage and disposal facilities must file with EPA; on all applications for a Federal Hazardous Waste Permit; and other hazardous waste management reports and documents required under Subtitle C of RCRA.

Chamiss 168E00647

### - REGISTRATION FOR UNDERGROUND STORAGE TANKS

STATE OF LOUISIANA DEPARTMENT OF ENVIRONMENTAL QUALITY OFFICE OF SOLID AND HAZARDOUS WASTE UNDERGROUND STORAGE TANK PROGRAM P.O. BOX 44274 BATON ROUGE, LA 70804-4274

RECEIVED BY STATE USE ONLY 180900 1.D. NUMBER 36 02 6095 APR 23 1986 TE RECEIVED 4/23/86 0 DATE CHECKED 10 GROUND W

### GENERAL INFORMATION

Registration is required by State and Federal law for all underground tanks that have been used to store regulated substances since January 1, 1974, that are in the ground as of May 8, 1986, or that are brought into use after May 8, 1986. The Information requested is required by the Louisiana Environmental Quality Act, L.R.S. 30:1051 et seq. as amended.

The primary purpose of this registration program is to locate and evaluate underground tanks that store or have stored petrolleum or hazardous substances. It is expected that the information you provide will be based on reasonably available records, or, in the absence of such records, your knowledge, belief, or recollection.

Who Mest Register? The Louisiana Environmental Quality Act, L.R.S. 30:1051 et seq. as amended. requires that, unless exempted, owners of underground tanks that store regulated substances must notify the Louisiana Department of Environmental Quality of the existence of their

fanks. Owner means—

(a) in the case of an underground storage tank in use on November 8, 1984, or brought into use

after that date, any person who owns an underground storage tank used for the storage, use, or dispensing of regulated substances, and (0) in the case of any underground storage tank in use before November 8, 1994, but no longer in use on that date, any person who owned such tank immediately before the discontinuation of its

What Tanks Are Included? Underground storage tank is defined as any one or combination of tanks that (1) is used to contain an accumulation of "regulated substances," and (2) whose volume (including connected underground piping) is 10% or more beneath the ground. Some examples are underground tanks storing: 1, gasoline, used oil, or diesel fuel, and 2, industrial solvents, pesticides, herbicides or furnigants

NOTE: Underground sterage tanks of less than 500 gailon capacity, which are req-restored by the Environmental Protection Agency, shall literatus register with overvor, these tanks are exempt from Louistana fees and regulations.

- What Tanks Are Excluded? Tanks excluded from Louisiana registration are: larm or residential tanks with a capacity of less than 500 gallons used for storing motor fuel for noncommercial ourposes:
- tanks used for storing heating oil for consumptive use on the premises where stored

accurate, and complete

Name and official title of owner or owner's authorized representative

3. Septic dails.
4. Oppeline Eduthies (including gathering lines) regulated under the Natural Gas Pipeline Safety Act of 1968, or the Hazardous Liquid Pipeline Safety Act of 1979, or which is an intrastate pipeline facility regulated under State laws:

- 5. surface impoundments: pits, ponds, or lagoons 6. storm water or waste water collection systems; 7. flow-through process tanks;

PROTECTION DIVISIONED BY

- 8. Includ traps or associated gathering lines directly related to oil or gas production and gathering
- operations.

  9. Storage tanks situated in an underground area (such as a basement, cellar, mineworking, drift, shaft, or tunnel) if the storage tank is situated upon or above the surface of the floor.

What Substances Are Covered? The registration requirements apply to underground storage tanks that contain regulated substances. This includes 10 any substance defined in section 101(14) of the Comprehensive Genironmental Response. Compensation and Liability Act of 1980 (but not including any substance regulated as a huardous waste under Substite C of the Solid Waste Disposal Act as amended by RCRA); and 2 i petroleum including crude oil or any fraction thereof which is figured at standard conditions of temperature and pressure (60 degrees Fahrenheit and 14.7 pounds per square inch absolute.)

Where to Register? Completed registration forms should be sent to the address given at the too.

When ta Register? 1. Owners of underground storage tanks in use or that have been taken out of operation after January 1. 1974, but still in the ground, must register by May 8. 1986. 2. Owners who bring underground storage tanks into use after May 8. 1986, must register within 30 days of bringing the tanks into use.

Registration Fee: The owners of operational or non-operational underground storage tanks containing regulated substances must submit with the registration form the payment of the registration fee for each underground storage tank according to the following schedule 1. For any substance defined in the Comprehensive Environmental Response. Compensation and

- Lability Act of 1980 (but not including any substance regulated as a hazardous waste under Subtile C of the Solid Waste Disposal Act as amended by RCRA)—525 00 per lank. 2. For petroleum, including crude oil or any fraction thereof which is liquid at standard conditions of temperature and pressure (60 degrees Fahrenheit and 14.7 pounds per square inch absolute).
- -\$15,00 per tank

In no case shall one owner be required to pay an aggregate registration fee in excess of one thousand dollars (\$1,000.00). In addition to the registration fee, an annual monitoring and maintenance fee is required commencing May 8, 1987 in accordance with the regulations.

Penalties: Any owner who knowingly tails to register or submits talse information shall be subject to a civil penalty not be exceed \$25,000 per day for each tank for which registration is not given or for which false information is submitted.

APR 23 1986

GROUND WATER PROTECTION DIVISION

Dear Sirs:

As required by your agency, Form for Registration for Underground Storage Tanks has been completed and is submitted for processing. Purchase Order No. DAHC21-86-M-4122 is enclosed to cover fees.

MTMC Gulf Outport has four 1000-gallon underground storage tanks used for petroleum products.

If there should be any questions, point of contact this Command is Michael J. Jambois, telephone (504) 942-6195.

Sincerely,

Michael A. Arnone

Chief, Office of Facility Engineer

## REGISTERED WELLS WITHIN ORLEANS PARISH (EXCERPTS)

### LOUISIANA DEPARTMENT OF TRANSPORTATION AND DEVELOPMENT

P.O. Box 94245, Baton Rouge, Louisiana 70804-9245

(504) 379-1434

NEIL L. WAGONER, P.E. SECRETARY

November 8, 1989

BUDDY ROEMER GOVERNOR

Mr. Tim Farrell Roy F. Weston, Inc. Goshen Office Weston Way West Chester, PA 19380

Re: Water Well Listing
User Supplied Coordinates
N 30 00' 00"; S 29 57' 00"
E 90 01' 00"; W 90 05' 00"
Orleans Parish

Dear Mr. Farrell:

As per your request of October 30, 1989, we are herewith enclosing the following for your information:

- A computer printout listing registered water wells and pertinent information about the wells
- 2) An explanation of the codes used on the printout
- 3) A library copy of W.R. Bulletin No. 9
- 4) A library copy of W.R. Basic Records Report No. 11
  - 5) A library copy of G.S. Water-Supply Paper 1296

Please be advised that this list does not include every possible water well which may have been drilled within the above-referenced coordinates. The list represents only those wells which have been registered with this Department or scheduled by the U.S. Geological Survey and does not include those which are presently being processed.

These library copies of reports are loaned to you on the condition that they be returned to this Department as soon as possible.

Mr. Timothy M. Farrell November 8, 1989 Page - 2 -

This information is made available through our cooperative water resources program with the U.S. Geological Survey.

If we may be of any further assistance, please do not hesitate to contact this office.

Very truly yours,

Z. "Bo" Bolourchi, P.E.

Chief, Water Resources Section

## EXPLANATION OF TERMS FOR THE COMPUTERIZED LISTING OF WATER WELLS AND HOLES WITHIN SPECIFIED COORDINATES

IDENTIFICATION NUMBER	-	This is a unique number that includes the latitude (first six numbers), longitude (second six numbers), and a sequential number which indicates the number of this well when other nearby wells have the same latitude and longitude.
REVISED COORDINATE	-	The top number is the identification number and the bottom number is the actual latitude and longitude of the well. (This is shown only if the identification number and the actual latitude and longitude are different).
OWNER'S NAME	-	Name of the individual, person, company or agency that owns or leases the well, and operates the well.
WELL NUMBER	-	Well Number, by parish, assigned by the U.S. Geological Survey and/or DOTD.
OWNER'S NUMBER	-	Well name or number assigned by the owner to identify each well.
WELL DEPTH	-	Depth of the well, in feet, measured from bottom of the screen to the ground surface.
WELL USE	•	Main use of the well.
WELL SUBUSE	-	Subuse of the well (see attached sheet).
DATE COMPLETED	-	The month and year the well was completed and/or accepted by the owner or lessee.
PUMPING RATE	-	Average daily pumping rate (GPD) as shown on the original registration form. A blank indicates the pumping rate is unknown.
AVAILABLE INFORMATION	-	Indicates available information as follows: E, geophysical log; L, drillers log; D, drill cuttings; C, chemical analysis; B, bacteriological analysis; P, pumping test; W, water level. Available information may be obtained from the DOTD, USGS, drilling contractor and/or other sources.

## DEPARTMENT OF WILDLIFE AND FISHERIES LOUISIANA NATURAL HERITAGE PROGRAM

Buddy Roemer

P.O. Box 98000 Baton Rouge, LA 70898

8 November 1989

Tim Farrell
R. F Weston Co.-Goshen Office
Weston Way
West Chester, PA 19380

Dear Mr. Farrell:

As per your request of 3 November, we have examined our database for any known occurrences of rare, threatened or endangered species within 3 miles of the proposed military ship loading port at the junction of the Mississippi River Gulf Outlet and the main channel of the Mississippi River. We do not have any records of sensitive species near the project site; however, a thorough survey has, to our knowledge, never been conducted.

We also conducted a search of our database for any records of sensitive species within the Mississippi River channel (i.e., between the levees and within the delta) from New Orleans to the mouth of the river. We have two records of the pallid sturgeon (Scaphirhynchus albus) from the main channel. This species has been proposed for federal listing. We also have records of another apparently rare fish, the saltmarsh topminnow (Fundulus jenkinsi), from the deltaic marshes. Finally, there are at least seven waterbird nesting colonies in this stretch of the river, also in the deltaic marshes.

I have also enclosed a list of all vertebrates documented from Orleans Parish. Any of those species could potentially be found at the project site. Refer to the enclosed list of LNHP-listed species to determine if any sensitive species could possibly be found at the site.

I hope these data are useful. If we can be of any further assistance, do not hesitate to contact us at the above address or (504) 765-2821.

Sincerely,

Laughester Gary Lester

LNHP-Coordinator

Spilogale putorius	eastern spotted skunk	<b>8</b> 5	છ	
Felis concolor coryi	Florida panther	ΕS	6411	
Trichechus manatus	manatee	<b>SA</b>	627	

Each element is assigned a single global rank; in addition, it receives a state rank for each state in which it occurs. State ranks within each state are assigned by the state Heritage program, and the rank for any particular element may vary considerably from state to state. Global ranking is done under the guidance of the national Science Department of The Nature Conservancy.

# GLOBAL ELEMENT RANKS:

- G1 = Critically imperiled globally because of extreme rarity (5 or fewer occurrences or very few remaining individuals or acres) or because of some factor(s) making it especially vulnerable to extinction.
- G2 = Imperiled globally because of rarity (6 to 20 occurrences or few remaining individuals or acres) or because of some factor(s) making it very vulnerable to extinction throughout its range.
- G3 = Either very rare and local throughout its range or found locally (even abundantly at some of its locations) in a restricted range (e.g., a single western state, a physiographic region in the East) or because of other factors making it vulnerable to extinction throughout its range; in terms of occurrences, in the range of 21 to 100.
- G4 = Apparently secure globally, though it may be quite rare in parts of its range, especially at the periphery.
- G5 = Demonstrably secure globally, though it may be quite rare in parts of its range, especially at the periphery.
- GH = Of historical occurrence throughout its range, i.e., formerly part of the established biota, with the expectation that it may be rediscovered (e.g., Bachman's Warbler).
- GU = Possibly in peril range-wide but status uncertain; need more information. NOTE: This rank should be used sparingly. Whenever possible, assign the most likely rank and add a question mark (e.g., G2?) to express uncertainty, or use a range (e.g., G2G3) to delineate the limits (range) of uncertainty.
- GX = Believed to be extinct throughout range (e.g., Passenger Pigeon) with virtually no likelihood that it will be rediscovered.

# STATE ELEMENT RANKS:

- S1 = Critically imperiled in state because of extreme rarity (5 or fewer occurrences or very few remaining individuals or acres) or because of some factor(s) making it especially vulnerable to extirpation from the state.
- S2 = Imperiled in state because of rarity (6 to 20 occurrences or few remaining individuals or acres) or because of some factor(s) making it very vulnerable to extirpation from the state.
- S3 = Rare or uncommon in state (on the order of 21 to 100 occurrences).
- S4 = Apparently secure in state, with many occurrences.
- \$5 = Demonstrably secure in state and essentially ineradicable under present conditions.
- SA = Accidental in state, including species (usually birds or butterflies)
  recorded once or twice or only at very great intervals, hundreds or even
  thousands of miles outside their usual range; a few of these species may
  even have bred on the one or two occasions they were recorded.
- SH = Of historical occurrence in the state but no recent records; may still exist. Upon verification of an extant occurrence, SH-ranked elements would typically receive an S1 rank. The SH rank is reserved for elements for which some effort has been made to relocate occurrences, rather than simply ranking all elements not known from verified extant occurrences with this rank.
- SU = Possibly in peril in state but status uncertain; need more information.

  NOTE: This rank is used infrequently, if the status of a species in the state is questionable a range of ranks (e.g., \$183) is used or a question mark is added to the rank considered most appropriate (e.g., \$1?).
- SX = Apparently extirpated from state.
